Amazon to Commence Drilling on Tocantins

Amazon Mining Holding Plc (“Amazon” or the “Company”) (AMZ:TSX-V) is pleased to announce that it has signed an agreement with Boart Longyear Geoserv of Brazil (“Boart”) a subsidiary of Boart Longyear Company, to conduct 1,500m of preliminary drilling on the Company’s Tocantins Gold Project.

Boart has been providing drilling services to the global minerals industry for over 100 years. Drilling is scheduled to commence by month’s end and results are to be expected during Q1, 2008. The Tocantins Gold Project, covering some 9,100ha, is located in an Achaean Greenstone Belt in the state of Tocantins, Brazil.

The concession is underlain by Precambrian granite-greenstone terrane and the region is an appendix to the São Francisco Craton. In 2006 Amazon’s exploration program focused on exploring the hinge zones of major folds and succeeded in identifying three priority areas for further detailed, two phase exploration. Phase one will consist of approximately 7,000m of reverse circulation (RC) and diamond drilling (DD). Phase two will consist of additional systemic and infill drilling with the preparation of a NI 43-101 compliant gold resource estimate as the combined program target.

About Amazon

Amazon is listed on the TSX Venture exchange and is a mineral exploration company engaged in acquiring and developing gold exploration properties in Brazil. Its strategic focus is to acquire projects with demonstrated potential for hosting gold deposits and to define resources through exploration and drilling campaigns.

Qualified Person

The technical and scientific information in this release has been reviewed by Dr. João Batista G. Teixeira, Chief Geoscientist of Amazon; a Qualified Person as described in NI 43-101 and a professional geologist with more than 39 years of experience.

On behalf of the Board of Directors of Amazon Mining Holding Plc,

Cristiano Veloso, President & Chief Executive Office
